

# WHEAT

Two aspects stand out in the second half of October: The approval of the first GMO wheat in Argentina HB4 with resistance to stress and the impacts of low humidity during the vegetative cycle and subsequent late rains. The decrease in supply globally is a trigger for better prices.

a) HB4: The Ministry of Agriculture approved the biotechnological event, conditioning its commercialization on the approval of Brazil and the registration of the new seeds in the National Seed Institute. This opens up a new scenario, mainly for exports, since there is currently a diversity of destinations; Although led by Brazil, which buys 40% of the volume, the other 60% is diversified between Southeast Asia, North Africa and South America (2020). There is uncertainty about the acceptance by mills and consumers of this approval, the impact on labeling regulations in certain destinations and the reactions to a bold launch in commercial matters.

b) Climate impact: The lack of rains in the July-October period will most likely condition the harvested area and the yields in a large area, a decrease in production of close to 20% is estimated. On the other hand, the rains of last week and the forecast of precipitations for November and December; as well as, periods of medium to high relative humidity and low insolation could predict the development of some end-of-cycle fungi. This possibly has its correlate in the quality of the grains.

Lower global supply: USA, Canada, European Union, Brazil, Argentina and Ukraine present forecasts of lower harvests and this has been a factor driving prices. Globally, 20 million tons less production is expected than the 19/20 harvest. The Argentine wheat export supply is estimated at 1.8 million tons less.

# SORGHUM

China appears as the main destination displacing Japan and everything indicates that a large part of the export of the next harvest would already be committed in these two destinations. The good 2020 prices of China, the permanence of Japan as a buyer and a somewhat better future for 2021, augur a good campaign. Spring and summer rains could consolidate the development for the near future of this cereal. New uses in the main Asian country and more competitive genetics will help this.

# CLIMATE IN ARGENTINA

Impressive drought that shows the map in satellite photography until the month of October. Corresponds to accumulation of moisture in the soil. However, the rains in the second half of October, and the forecasts for November, December and January suggest a good implantation and development of summer crops such as corn, soybeans, sorghum and sunflower in the humid pampas.
